

1, Explain behaviour of hub device

- * Connecting multiple devices A, B, C to form a network.
- * It is a Broadcast device.
- * Same time we cannot communicate & transfer the data.
- * It is a half duplex & it works on layer 1

2, Explain behaviour of switch device

- * When it send data's to source mac it will create the mac table.
- * 1st time it will broadcast to all device.
- * 2nd time the switch check the data under the table than it will unicast bcoz it know the source mac.
- * It's works on layer 2 [Data Link layer].

3, Explain behaviour of router device

- * Router having a condition :-
"Different network"
- * Routing table contains list of routes & routing table also.
- for eg :-
- * forwarding a data packet to one network to other or another network it is called Routing.
- It's unicast device works on layer 3.
- * If we have same network Ip it will Broadcast in same department.
